Pickup and Delivery Platform

We want to build business model and technology same like https://www.roadie.com/

1. App for Driver (Android & iOS)

2. App for Sender (Android & iOS)

3. Web login for Drivers

4. Web login for sender / businesses

5. Super Admin Panel

6. Frontend website like https://www.roadie.com/

For Driver

- Driver can accept multiple pickup requests which are on his route or not too far away, same like UBER app. Sender will be able to track Driver's live location, if the Driver is doing multiple deliveries on his route the sender will be able to see that the driver is completing another delivery and your delivery will reach between x to y time.

- Driver dashboard will show his earning details for delivery charges, delivery tip. Also Driver will be able to see his payment details for the earning, payment details will be uploaded by our admin via excel sheets.

For Sender

For the businesses who already have customer app like Walmart etc. > our API will integrate with their apps to receive pickup requests, match drivers, track delivery status and confirm deliveries via timestamp or signature.

https://docs.roadie.com/?_ga=2.204190420.537127580.1586550098-1341694329.1586550098#api-overview
Our APIs should be able to be in all type of coding platforms, same like Roadie APIs, refer to the above link for details.

Small businesses who do not have apps to integrate or the individuals who want to send something from one place to another place > they will use our app to place pickup requests, match drivers, track delivery status and confirm deliveries via timestamp or signature.

Business partners who use our Drivers' fleet will have web login panel

- They can manage the functions of the business app from web panel also.
- They can check detailed history of deliveries> Successful/ unsuccessful/ in process
- They can check detailed history of delivery charges, delivery payments. Payment details will be uploaded by our admin via excel sheets.
